

Figure S3 Comparison of Hog1 ORF occupancy data to previous work. Hog1 occupancy measured by ChIP-seq from the present study (osmotic shock was induced with 0.4 M KCl for five minutes; quantities plotted are: mock-subtracted enrichment over input, left panel; or enrichment over input, right panel) plotted against Hog1 occupancy measured by enrichment over input in ChIP-chip (Pokholok *et al.* 2006) during osmotic shock induced by 0.4 M NaCl for five minutes. Each point represents one ORF, and ORFs plotted are those designated as Hog1 occupied by either study.
