Figure S5  Frequency of lower 95% confidence interval of $\hat{N}_e$ from 10000 estimates when simulating a population size of $N=60000$ at different $P_{\text{crit}}$ values. The frequency of all $N_e$ estimates less than 100000 and greater than 100000 were pooled and are indicated on the x-axis limits of each graph.
