Figure S1  Genetic mapping of X-linked genes. The X-linkage map was constructed from the recombination values given in Table S7. The distances between each of the four X-linked genes (SIX1, SIAP3X, DD44X, and SIX4) correspond to those between the adjacent genes. The positions of the other six X-linked genes and the pseudoautosomal region (PAR) are based on the previously published map (Bergero et al. 2007).
