

SUPPORTING INFORMATION

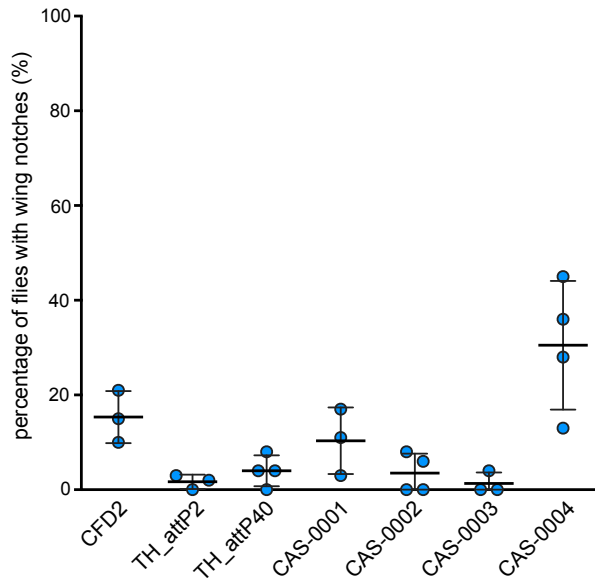

Figure S1. Assessing somatic activity of *nos-cas9* lines in combination with *U6:3-gRNA-wls*. Flies expressing the indicated *nos-cas9* line and *U6:3-gRNA-wls* were examined (typically 30 - 50 flies per cross) and the number of flies with notches of the wing margin counted. Dots represent data from individual crosses with mean \pm SD indicated as lines. Notches were always small ($< 10\%$ of wing area) and only present in the minority of animals, demonstrating low levels of somatic activity.
