

## About G3

G3: *Genes | Genomes | Genetics* (ISSN 2160-1836) is an open-access, peer-reviewed and peer-edited journal published monthly by the Genetics Society of America (GSA). The journal seeks to serve the genetics community by providing an outlet for dissemination of findings and experimental resources in genetics and genomics—an outlet unrestricted by subjective editorial criteria of perceived significance or predicted breadth of interest. G3 is interested in publishing papers that describe useful, well-executed and lucidly-interpreted genetic studies of all kinds, from those involving microbes to humans, from individuals to populations, and from classic “wet lab” experimentation to the most recent innovations in bioinformatics.

Through a fair and rapid peer-review and publication process, G3 seeks to provide a unified home for reporting genome sequences, genetic and physical maps of organisms, mutant screens, QTL mapping, genome wide association studies, as well as many other important and useful datasets. The GSA through G3 recognizes its responsibility to enable documentation of reagents and resources, descriptions of high-quality foundational work in developing areas of genetics, and datasets for meta-analysis, to name a few.

Publication is open equally to members and nonmembers of the GSA. G3's articles are distributed under the terms of the Creative Commons Attribution Unported License (<http://creativecommons.org/licenses/by/3.0/>), which permits unrestricted use, distribution, and reproduction in any medium, provided the original work is properly cited. For more information, please refer to our Instructions for Authors or contact the Editorial Office.

## About the Cover

A *Drosophila* egg chamber expressing GFP (green) under the control of *c96-GAL4*, an enhancer trap in the multi-PDZ domain gene *big bang*. *c96-GAL4*-driven GFP is present in border cells at the anterior end of the egg chamber (left) and in the majority of follicle cells. The egg chamber is co-stained with E-cadherin (red) to label cell membranes and DAPI (blue) to label nuclei. Knockdown of *big bang* and additional PDZ domain-encoding genes by RNAi disrupts border cell migration (see Aranjuez et al., pp. 1379–1391). Image courtesy of George Aranjuez.

### Editor-in-Chief

Brenda Andrews  
University of Toronto

### Executive Editor

Tracey DePellegrin Connelly

### Board of Senior Editors

Dirk-Jan de Koning  
Swedish University of Agricultural  
Sciences

Katrien M. Devos  
The University of Georgia

Susan L. Forsburg  
University of Southern California

R. Scott Hawley  
Stowers Institute for Medical Research

Stephen W. Scherer
