The ternary plot represents the cell type specific expression of the top 500 differential expressed probes in a microarray study of the human pathogen *P. marneffei*. Each spot represents a different probe with the intensity correlated to the level of expression and the position to the level of expression in each cell type. The apices of the triangle show scanning experiment to the "wet lab" experimentation to the most recent innovations in bioinformatics.

Through a fair and rapid peer-review and publication process, G3 seeks to provide a unified home for reporting genome sequences, genetic and physical maps of organisms, mutant screens, QTL mapping, genome wide association studies, as well as many other important and useful datasets. The GSA through G3 recognizes its responsibility to enable documentation of reagents and resources, descriptions of high-quality foundational work in developing areas of genetics, and datasets for meta-analysis, to name a few.

Publication is open equally to members and nonmembers of the GSA. G3's articles are distributed under the terms of the Creative Commons Attribution Unported License (http://creativecommons.org/licenses/by/3.0/), which permits unrestricted use, distribution, and reproduction in any medium, provided the original work is properly cited. ### About G3

G3: Genes | Genomes | Genetics (ISSN 2160-1836) is an open-access, peer-reviewed and peer-edited journal published monthly by the Genetics Society of America (GSA). The journal seeks to serve the genetics community by providing an outlet for dissemination of findings and experimental resources in genetics and genomics—an outlet unrestricted by subjective editorial criteria of perceived significance or predicted breadth of interest. G3 is interested in publishing papers that describe useful, well-executed and lucidly-interpreted genetic studies of all kinds, from those involving microbes to humans, from individuals to populations, and from classic "wet lab" experimentation to the most recent innovations in bioinformatics.

### About the Cover

The ternary plot represents the cell type specific expression of the top 500 differential expressed probes in a microarray study of the human pathogen *P. marneffei*. Each spot represents a different probe with the intensity correlated to the level of expression and the position to the level of expression in each cell type. The apices of the triangle show scanning electron micrographs of the various *P. marneffei* cell types examined with yeast cells (top), hyphal cells (bottom left) and conidiophore cells (bottom right). See Pasricha et al., pp. 1997–2014.
