

Figure S11 Synteny conservation around the rDNA clusters located on the left arm of *P. sorbitophila* chr E and F. Within the five CTG species, orthologous genes (or alleles for *P. sorbitophila*) are represented by same colors and line connected. The locus name is indicated for each species according to the published nomenclature. For *P. sorbitophila*, both loci and alleles are indicated (see also Figure S8). Hatched box corresponds to pseudogene. Syntenic breakpoint is represented by an arrow.
