

Figure S1 Psc overexpression induces arista-to-tarsi transformation. (A) Anderson et al., 2011 demonstrated that the arista of *Drosophila* antenna transforms to tarsi of the leg when the activity of CAF1p55 is compromised. Overexpression of Psc from f00391 in an eye-antennal-specific manner also induces arista-to-tarsi transformation, mimicking the developmental phenotype associated with compromised CAF1p55 function.
