

Figure S1 The *neo1Δ cfs1Δ* mutant shows almost normal localization of GFP-Snc1p. Strains expressing *GFP-SNC1* were grown to exponential phase in YPDA medium at 30°C, followed by observation using a fluorescent microscope. The *P_{GAL1}-3HA-NEO1* strain was cultured as in Figure 6. The strains used were wild type (YKT1523), *cfs1Δ* (YKT2055), *P_{GAL1}-3HA-NEO1* (YKT2062), and *neo1Δ cfs1Δ* (YKT2104). All of them carry *P_{TPII}-GFP-SNC1* integrated at the *URA3* locus. Bar, 5 μm.
