

Figure S5 Histograms of similarity measures for the expression arrays for each tissue, versus all other tissues combined. The panels on the left include self-self similarities (along the diagonal of the similarity matrices); the panels on the right include all self-nonself similarities (the off-diagonal elements of the similarity matrices). Self-self values < 0.8 and self-nonself values > 0.8 are highlighted with red tick marks. The two modes in the self-nonself distributions are for opposite-sex and same-sex pairs.
