

Figure S9 Between-tissue correlations for pairs of tissues for an inferred sample duplicate, with Mouse3141 in liver really being a duplicate of Mouse3136 in liver. Correlations are calculated using tissue-pair-specific probes that show between-tissue correlation, across all mice, of > 0.75. Tissue pairs are abbreviated by the first letter of the tissues' names. Red points involve Mouse3136 liver, green points involve Mouse3141 liver, and the purple point involves both.
